

CALCULATOR USER MANUAL

As you can see, we have a calculator panel like bellow when you start the app:

There exist 10 number and “.” to make decimal numbers.

Also, you have 4 operators. Sum, sub, mult, div to summate, subtract, multiple or divide one number with another.

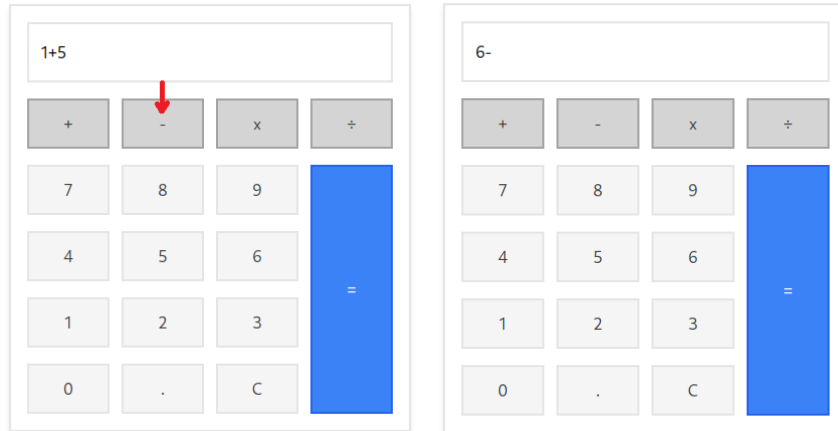

You can insert a number and then operation and again another number. After that click on “=” button to see the results.

If you click on an operator before you enter a number, it doesn’t insert anything.

If you enter an operator after another one instead of number, it doesn’t insert anything.

If you have an operator and 2 number and again you want to enter an operator, the calculator calculates the result of first expression (2 number with 1 operator) then you can see result of first expression with the operator you inserted after that. Like bellow:

CALCULATOR USER MANUAL

If you enter “=” after an operator with just 1 number, calculator assume that the second number is 0 and does the operation.

You can work with calculator just with its’ buttons and not with your computer keyboards. You also can not change the place of cursor in input field of calculator by mouse or keyboard.
